

● PROBLEM

AI agents increasingly **pay vendors, settle invoices, and move treasury funds** — but institutions cannot trust agent-initiated transfers without **verified identity, clean funds, Travel Rule compliance, and a complete audit package**. Current agent wallets produce unsigned, unauditable crypto transfers.

● SOLUTION

CleanMandate is a verified payment mandate layer. A principal issues a structured mandate — recipient, amount, asset, purpose, Travel Rule metadata. Before any transfer, a **fixed compliance pipeline** executes: policy check, sanctions screening, consensus lock, and compliant settlement on **Monad** via **A-Token**.

MANDATE EXECUTION PIPELINE

CLEANVERSE INTEGRATION

DEMO FLOW

🕒 DURING HACKATHON

- Integrate Cleanverse API v3 sandbox for all three primitives
- Wire full Travel Rule payloads (originator/beneficiary names, wallets, VASPs, purpose)
- Execute compliant A-Token transfers on Monad testnet
- Ship Rust client (cm-cleanverse) with mock + sandbox modes

⚡ POST-HACKATHON

- Publish as Agent Skill via MCP (agent-conductor integration)
- Mandate templates for vendor payments, payroll, treasury sweeps
- Partner with institutions needing agent payment rails
- Extend to x402 and agent-commerce protocols
